

Joint Hall A&C Data Analysis Workshop

Overview & Update of the Hall-C Analyzer

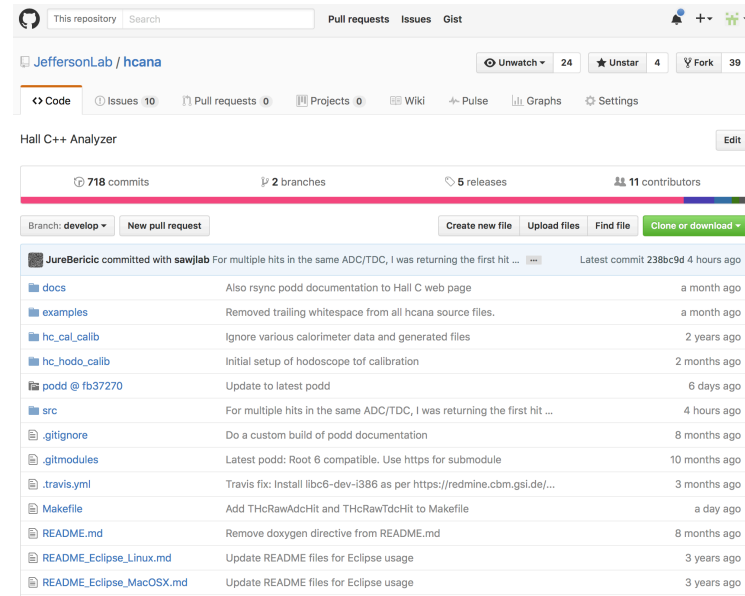

Eric Pooser

Jefferson Lab

06/25/2018

Hall-C Analyzer Overview

- Hall-C ROOT Analysis framework (HCANA) is written in C++ and is an extension of the Hall A analyzer “podd”
 - Based on previous Fortran Analyzer ENGINE infrastructure
 - [Hall C ROOT Analyzer Wiki](#)
- Maintained on [GitHub](#) →
- Users fork off of “develop” branch
- Contributions are made in local/remote personal repository of HCANA
- Changes are pushed back onto the development branch which (may) get merged into the development branch
- Detailed ["How-To" wiki](#): instructions how to “Git” started with HCANA and GitHub →

Contents [\[hide\]](#)

- 1 Setting up Git
 - 1.1 Firewall issues at JLab
 - 1.2 Non-fatal errors/warnings running git on ifarm
 - 1.3 List your global git configuration
- 2 Retrieving the Hall C analyzer with git
 - 2.1 Setup and creating a personal fork of the analyzer
 - 2.2 PODD submodule
 - 2.3 Keeping personal fork up to date
 - 2.4 Editing code and contributing back
 - 2.5 Useful commands for cleaning up git commit history
 - 2.6 Read only access
- 3 Using the analyzer
- 4 Git References

Steps to Install HCANA

1. Download and install [ROOT](#) (> 5.32)
2. Setup ROOT environment
 - `source /path/to/rootbuild/bin/thisroot.(c)sh`
3. Fork [hcana repository](#) (if you have not already done so)
4. Clone personal remote repository on local machine
 - `git clone https://github.com/username/hcana`
5. cd into “hcana” directory and setup the environment
 - `source setup.(c)sh`
6. Obtain the podd submodule which hcana points too
 - `git submodule init`
 - `git submodule update`
7. Create new branch and switch to it
 - `git checkout -b branch-name`
8. Build HCANA
 - `scons -j4`

THcDC Class Reference
Main detector classes

List of all members | Public Member Functions | Protected Member Functions | Protected Attributes | Static Protected Attributes | List of all members

This class analyzes a package of horizontal drift chambers. It uses the first letter of the apparatus name as a prefix to parameter names. The parameters, read in the Setup method, determine the number of chambers and the number of parameters per plane.

Author
S. A. Wood, based on Fortran ENGINE

Work Flow of HCANA

- HCANA utilizes the Hall-A podd decoder to unpack raw EVIO data into THaEvData objects
 - Each readout module (F250, 1190, ...) has its own decoder class → `podd/hana_decode`
- THcHitList utilizes the detector maps to associate the ROC, slot, & channel number with a specific detector
 - `THcHitList::DecodeToHitList(&THaEvData)`
- THcDetectorMap builds an array (fTable) with one structure element per readout channel
 - `THcDetectorMap::Load(const char *fName)`
- Each element holds the roc, slot, channel number and module type for a given channel
- In addition, the element holds the id number of the detector, the plane, the counter (or wire number), and the signal number (ADC/TDC, +/-)

Work Flow of HCANA

- At initialization each detector class has its detector map populated with the list of readout channels belonging it
 - `gHcDetectorMap->FillMap(fDetMap, idstring)`
- In addition, a hit list is created to hold the raw hits for each respective detector
 - `THcHitList::InitHitList(fDetMap, rawhitclassname, maxhits)`
- Detector classes then decode the THcHitList data into raw hit data associated with a specific detector's readout channel
 - `THcDetector::Decode(&THaEvData)`
- Raw hit information is stored as TClonesArray objects which are accessible *via* THcAnalyzer
 - `adcPulseAmpRaw, adcPulseAmp, ...`

Work Flow of HCANA

- Raw hit data is further processed into higher level hit data objects *via* fiducial ADC & TDC cuts
 - `THcDetector::CoarseProcess(&TClonesArray)`
 - `goodAdcPed, goodAdcPulseInt, ...`
- Hit data can then be further processed into higher level physics data
 - `THcDetector::FineProcess(&TClonesArray)`
 - Fiducial tracking cuts e.g. χ^2/ndf , β , E/p
 - Track matching, efficiencies, ...
- Raw, hit, & physics data is then processed by THcAnalyzer which makes the data available *via* ROOT histograms and TTrees

Recent Updates to HCANA: e9d8699

- BCM Module: **THcBCMCurrent**
 - Sanghwa's Slides
- Reads average BCM current values from scaler parameter file
- Writes values into bcm#.AvgCurrent event by event
- Compares the current readout values with the threshold and sets event flags (0, 1)
- The threshold current can be configured in two ways
 - SetCurrentCut()
 - gBCM_Current_threshold

P.BCM4B.scalerCurrent

P.bcm.bcm4a.AvgCurrent

Recent Updates to HCANA: 4cb3bfb

- Missing reference times are now printed in the analyzer summary
 - End(THaRunBase *run)** added to each detector class
 - THcHitList::MissReport(const char *name)**

```
Normal end of file ./raw/shms_all_02484.dat encountered
Missing Ref times:      T.shms      0      4152
Missing Ref times:      P.ngcer     0      3484
Missing Ref times:      P.dc        0        0
Missing Ref times:      P.hod       0      4166
Missing Ref times:      P.hgcer     0      1519
Missing Ref times:      P.aero      0      2161
Missing Ref times:      P.cal       0      3021
THcScalerEvtHandler::End Analyzing 3 delayed scaler events
End of file
```

TDC **ADC**

Recent Updates to HCANA

- Reference time selection is dependent on the first TDC/FADC hit in the window which is greater than the associated cut

- $X_t(a) \text{ dcrefcut}$

- “Good” FADC hits are determined via. time difference cuts for every FADC readout channel

- $X_{\text{adcTimeWindowMin (Max)}}$

Hall A/C Data Analysis Workshop

Jefferson Lab

Recent Updates to HCANA

- Creation of **THcReactionPoint**
 - Calculates the z-vertex at the target in the transport coordinate system →
 - The x & y vertex are defined via **gbeam_x(y)** offsets and the raster position
- Modification to **THcDC** & **ThcDCTrack** now provides per plane residual calculations excluding the plane for which the residual is being calculated →
 - **X.dc.residualExclPlane**
 - **vector <Double_t>**

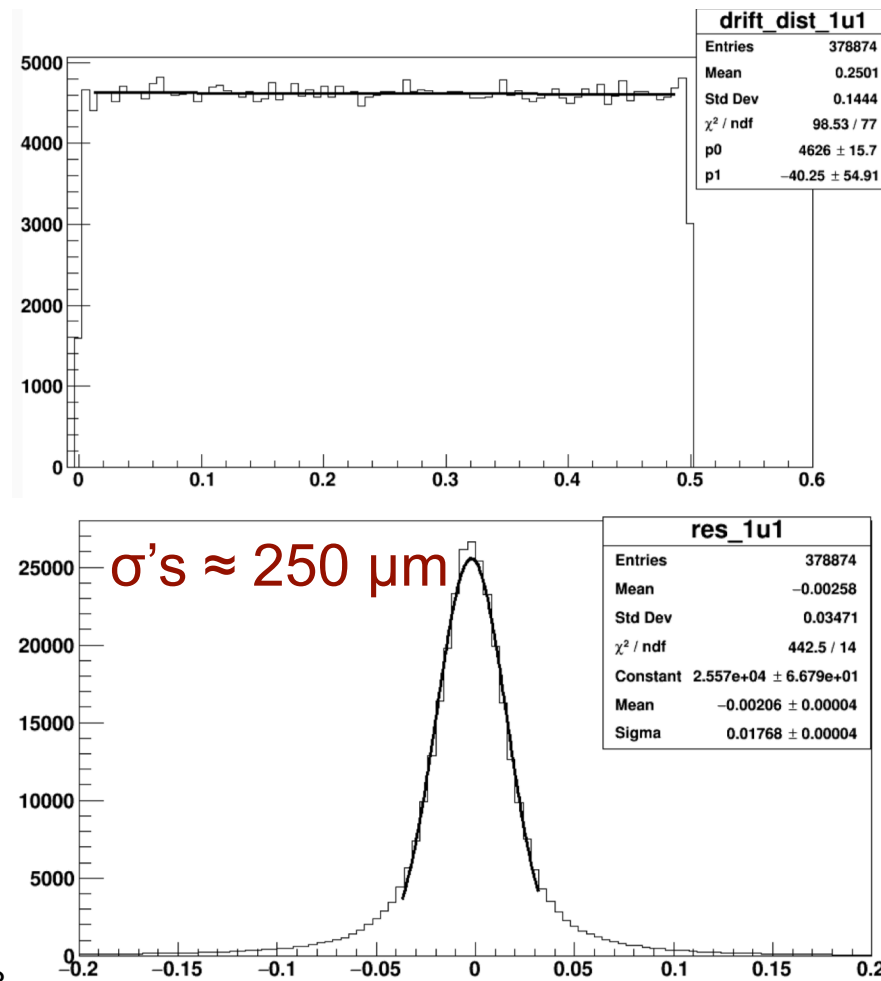

Recent Updates to HCANA: e06d50f

- Bug fix in **THcHodoscope**
- **fFPTTimeAll** is the average FPT as calculated by all scintillator times
- **fFPTTimeAll** was calculated in **EstimatedFocalPlaneTime()**, where it was set to the **starttime** defined to be the average FPT calculated without using a DC track
- For tracks, a FPT was calculated for each track by utilizing the track information in order to improve the FPT calculation and was saved for each track
- **fFPTTimeAll** was being filled for each track, and thus the last track
- **fFPTTimeAll** was moved to **THcHodoscope::FineProcess** and is now set to the average FPT of the golden track

- Data calibrated with run 2540
- Data shown with the same kinematics is for run 2525

Recent Updates to HCANA: 8a26c04

- FADC's modules found to have their trigger times (internal 250 MHz clock) slip randomly by 4 ns with firmware present during fall 2017 and spring 2018 run
- Correction applied in **THcHitList::DecodeToHitList()** via of comparing trigger time provided by the TI module to the trigger time in each FADC module

SHMS Defocused Run 1791 With No FADC Timing Corrections (Slot 3)

SHMS Defocused Run 1791 With FADC Timing Corrections (Slot 3)

Recent Updates to HCANA: d6e15d1

- Creation of coincidence time module
THcCoinTime
- Documentation
- Facilitates the analysis of coincidence time data
- Derived from THaPhysicsModule
- The spectrometers central path length and coincidence time offset are parameters in hallc-replay
- Coincidence times for various particle species are supported

Eric Pooser

SIDIS Run 4145: Electron-Hadron Coincidence Time

CTime.ePiCoinTime_ROC2 {(H.cer.npeSum>0.4 && H.cal.etracknorm>0.7)&&(P.aero.npeSum>2.)}

Hall-C Replay

- Framework designed to facilitate the reconstruction of events in the Hall-C spectrometers
- The [Hall-C Replay Strucutre Wiki](#) provides general information regarding the infrastructure
- The Hall-C replay code is maintained in the [JeffersonLab/hallc_replay](#) GitHub repository
- Interfaces with THcAnalyzer to process and obtain the data
 - Raw, hit, & tracking data
 - Physics data

Hall-C Replay: DEF-files

CONFIGURATION FILES

```
block App.det.*
block App.det.var*
```

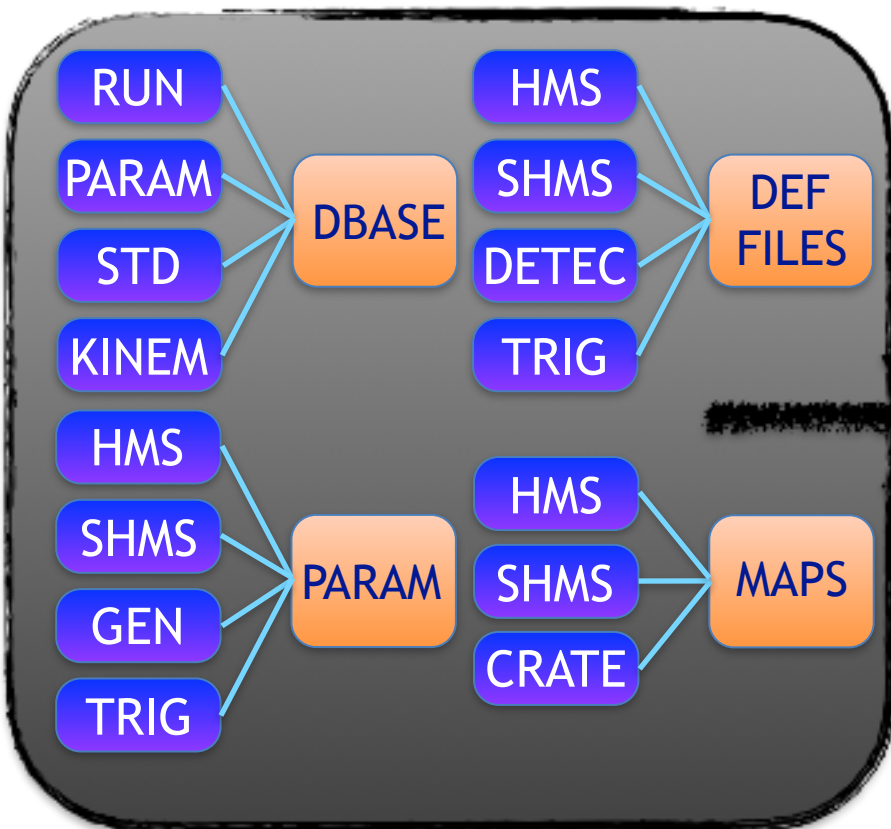

```
TH1F h1Name 'Title; X-Title; Y-Title' var nBins xLow xHigh
TH1I h2Name 'Title; X-Title; Y-Title' var nBins xLow xHigh cut1&&cut2||cut3
TH2D h3Name 'Title; X-Title; Y-Title' var1 var2 nBins xLow xHigh nBins yLow yHigh
TH2D h3Name 'Title; X-Title; Y-Title' [I+1] var2 nBins xLow xHigh nBins yLow yHigh cut4
```

- [THaOutput Analysis Output](#) (DEF-files)
- Interfaces with THcAnalyzer to output user defined histograms and ROOT TTrees
- Variables are created in detector classes in the DefineVariables() method and can be written to the TTree output and histogrammed via DEF-files
 - `P.hodo.goodAdcPulseAmp`
- Block variables write multiple variables to the TTree with a single call
 - `block P.gtr.*`
- Histograms can be defined for specific variables with and without cuts (1, 2, & 3D supported)
 - `TH1F h1Name 'Title; X-Title; Y-Title' var nBins xLow xHigh`
 - `TH1F h1Name 'Title; X-Title; Y-Title' var nBins xLow xHigh cut1&&cut2||cut3`
- DEF-files defining cuts create global cut objects for histograms and interactive analysis
 - `time_cut1 P.dc.1u1.time>0&&P.dc.1u1.time<250`

Hall-C Replay: Results

CONFIGURATION FILES

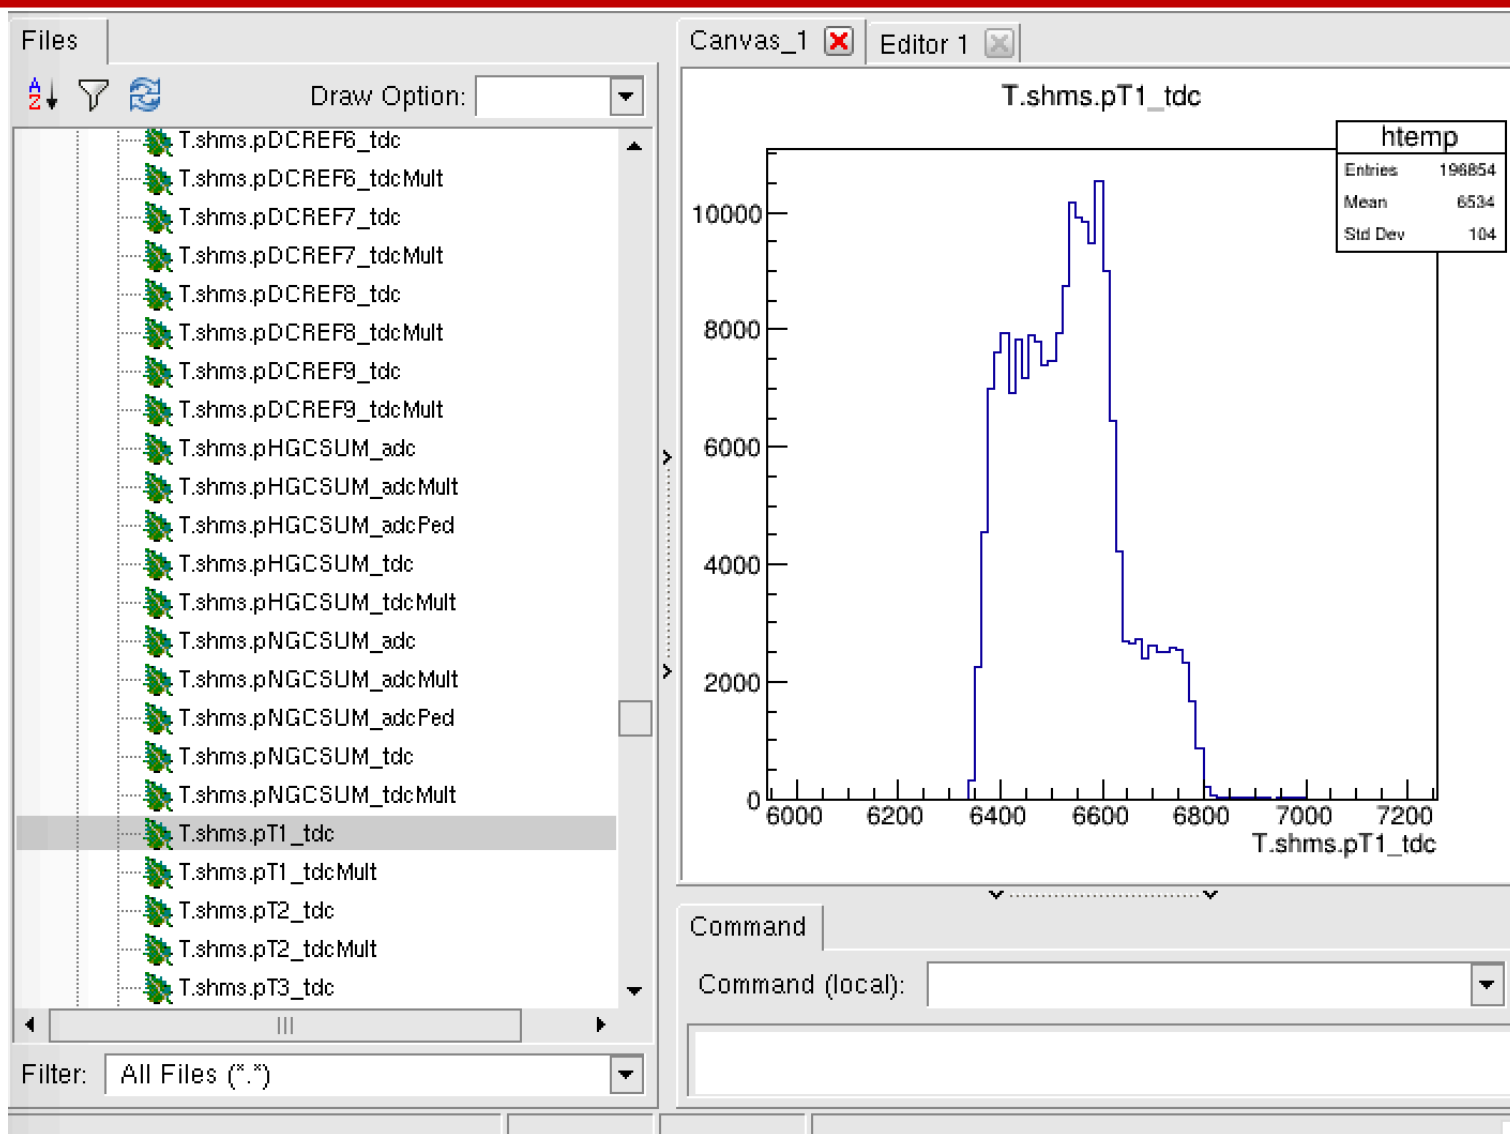

ANALYSIS FILES

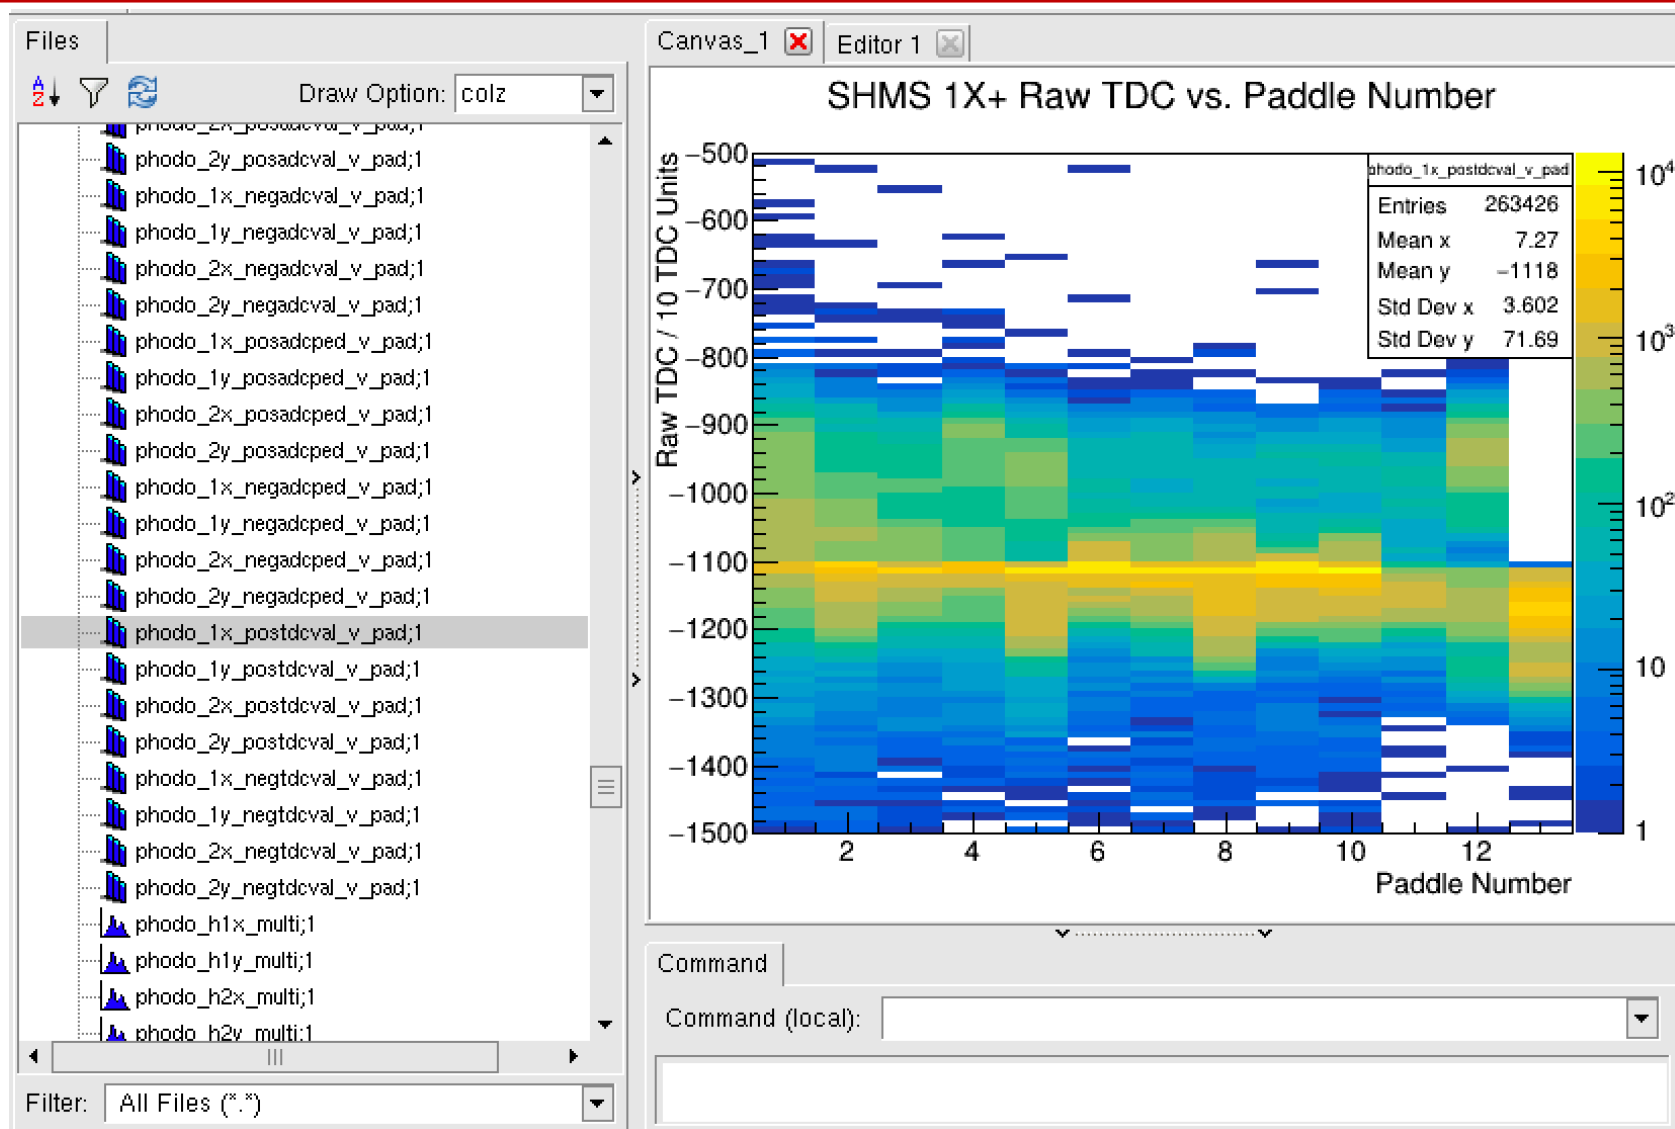

RESULTS

Hall-C Replay: ROOT TTree

Hall-C Replay: DEF-Files Histograms

Recent Updates to Hall-C Replay

- Hall-C replay reconfigured to specifically support online analysis: [#403](#)
- Run specific calibrations and parameter configuration removed so that the replay is specific to experiment which is currently on the floor
- The previous run specific configuration is preserved with the [tagged release 1.0](#)
- Submodules configured for specific run groups so they have complete control of the online & offline replays

| | |
|-----------------------|---|
| CALIBRATION | Update SHMS calorimeter calibration (#467) |
| DATFILES | Updated SHMS optics reconstruction |
| DBASE | Spring 2018 ver30 (#461) |

| .rootrc | Updating repo |
| run_coin_hms.sh | Spring 2018 ver19 (#425) |
| run_coin_shms.sh | Spring 2018 ver19 (#425) |
| run_hms.sh | More clean up (#405) |
| run_shms.sh | More clean up (#405) |
| setup.csh | Rearrange db_run.dat and db_cratemap.dat |
| setup.sh | Added setup.sh . |

Recent Updates to Hall-C Replay

- The experiment specific submodules is where the following should reside:
 - Shell scripts
 - Custom replay scripts
 - DEF-files
 - Monitoring scripts
 - Macros
 - Symbolic links to data files stored in the experiments directory on the RAID disk
 - Parameter files, etc.
- UTIL_OL is general utility submodule for online operations
 - Pedestal monitoring, report file monitoring, ...

| PARAM | Hms hodo calib work (#463) |
| SCRIPTS | added THcCoinTime class to replay_production_coin_hElec_pProt.C |
| TEMPLATES | Modify coin_production.template |
| UTIL_CT @ efa4df8 | Update submodules |
| UTIL_ED @ 76dc574 | Update submodules |
| UTIL_F2_XEM @ 7cc21dd | Spring 2018 ver19 (#425) |
| UTIL_OL @ fc95272 | Update submodules |
| UTIL_SIDIS @ 65f6701 | Update submodules |
| onlineGUI | Spring 2018 ver29 (#456) |
| .gitignore | Include run scripts (#404) |
| .gitmodules | Add utilities submodule for SIDIS (#436) |
| .rootrc | Updating repo |
| run_coin_hms.sh | Spring 2018 ver19 (#425) |
| run_coin_shms.sh | Spring 2018 ver19 (#425) |
| run_hms.sh | More clean up (#405) |
| run_shms.sh | More clean up (#405) |
| setup.csh | Rearrange db_run.dat and db_cratemap.dat |
| setup.sh | Added setup.sh . |

Recent Updates to Hall-C Replay

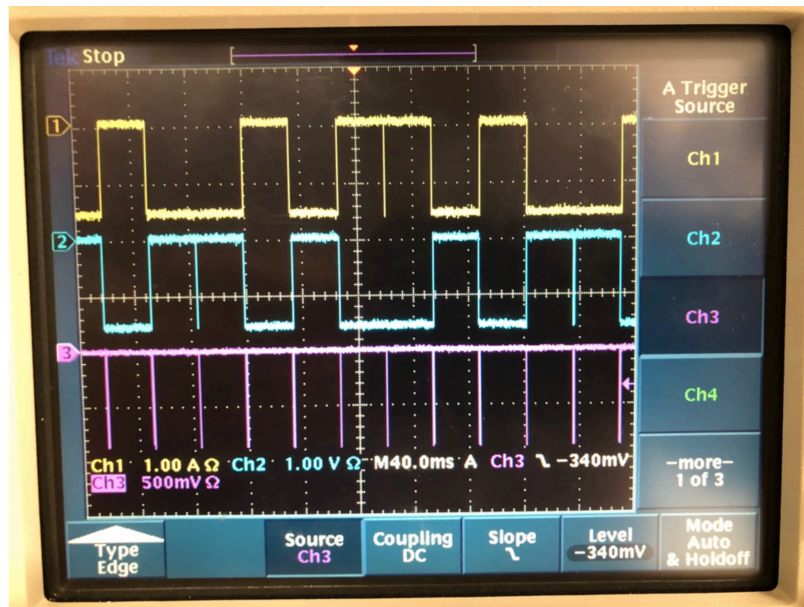

- New calibration code exists for the calorimeter, drift chambers, and hodoscope's
 - See various talks during Tuesday morning (10:45 - 12:15) session
- Helicity gated scalers and FADC channels included in ROOT tree
