- Implemented energy, momentum and angle offset with positive sign on both DATA and SIMC.
- Implemented Out-of-plane offsets to DATA (**HMS = +0.0019rad and SHMS = -0.00005rad**).

HEEP Study

- Made HeePCoin comparison plots and calculated Data/SIMC Ratio.
- Calculated errors in ratios properly.
- SIMC and Data is normalized.

$$Effective\ charge = Charge \times Tracking\ Eff \times Detector\ Eff \times Hodo\frac{3}{4}Eff \times EDTM\ Live\ Time \times Boiling\ Corr$$

- In data normalization, Following quantities are included:
  - **Charge (run-by-run)**
  - **Tracking Efficiencies (HMS and SHMS run-by-run)**
  - **Detector Efficiencies (HMS Cer and HMS Cal run-by-run)**
  - **Hodo ¾ Efficiencies (HMS and SHMS run-by-run)**
  - **EDTM Live Time (run-by-run)**
  - **Dummy Target Thickness Correction Applied – (3.527 +/- 0.227 - PionLT)**
  - **Richard's Boiling Correction Applied (-0.0007899) - From Richard**

In progress:

- Working on data/simc ratios.
- Looking into SHMS ¾ Hodo Efficiency.
- Will work on Proton absorption correction.

HEEP Study

- Uncertainties Calculations (Absolute):
- Used raw histograms (after cuts) for error calculation.
- Took integral and error using ROOT (IntegralAndError())

- Effective charge is calculated as (calculated run-by-run);

$$Effective\_charge\_run\_i = Charge \times Tracking\ Eff \times Detector\ Eff \times Hodo\frac{3}{4}Eff \times EDTM\ Live\ Time \times Boiling\ Corr$$

$$Effective\_charge\_run\_i\_err = Effective\_charge\_run\_i \times \sqrt{\left(\frac{charge\_error}{charge}\right)^2 + \left(\frac{Tracking\_Eff\_error}{Tracking\_Eff}\right)^2 + \left(\frac{Detector\_Eff\_error}{Detector\ Eff}\right)^2 + \dots\dots}$$

- Total effective charge is calculated as;

$$Total\_effective\_charge = Effective\_charge\_run1 + Effective\_charge\_run2 + Effective\_charge\_run3 + \dots\dots\dots\dots..$$

$$Total\_effective\_charge\_err = \sqrt{(Effective\_charge\_run1\_err)^2 + (Effective\_charge\_run2\_err)^2 + \cdots\dots..}$$

- For dummy, also included thickness correction factor.

HEEP Study

- Data/SIMC Ratio is calculated as (calculated run-by-run);

$$DataSimc\_Ratio = \frac{Normalized\_data\_dummy\_sub}{Normalized\_simc}$$

$$Normalized\_data\_dummy\_sub = Normalized\_data - Normalized\_dummy$$

$$Normalized\_data = Data\_counts/Total\_data\_effective\_charge$$

$$Normalized\_data\_err = Normalized\_data \times \sqrt{\left(\frac{Data\_count\_error}{Data\_counts}\right)^2 + \left(\frac{Total\_data\_effective\_charge\_error}{Total\_data\_effective\_charge}\right)^2}$$

$$Normalized\_dummy = Dummy\_counts/Total\_dummy\_effective\_charge$$

$$Normalized\_dummy\_err = Normalized\_dummy \times \sqrt{\left(\frac{Dummy\_count\_error}{Dummy\_counts}\right)^2 + \left(\frac{Total\_dummy\_effective\_charge\_error}{Total\_dummy\_effective\_charge}\right)^2}$$

$$Normalized\_data\_dummy\_sub\_err = \sqrt{(Normalized\_data\_err)^2 + (Normalized\_dummy\_err)^2}$$

$$Normalized\_simc = simc\_counts/(simc\_nevents/simc\_normfactor)$$

$$Normalized\_simc\_err = Normalized\_simc \times \left(\frac{simc\_count\_error}{simc\_counts}\right)$$

$$DataSimc\_Ratio\_error = DataSimc\_Ratio \times \sqrt{\left(\frac{Normalized\_data\_dummy\_sub\_err}{Normalized\_data\_dummy\_sub}\right)^2 + \left(\frac{Normalized\_simc\_err}{Normalized\_simc}\right)^2}$$
